1. Project Overview

This project involved reviewing the existing Cynbit website and identifying opportunities to improve navigation, content presentation, and the process of initiating client inquiries.

The objective was to make essential information easier to discover and interactions more intuitive while maintaining the professional identity of the original website.

The redesign focuses on four key areas: navigation clarity, page orientation, contact form accessibility, and service discoverability.

2. Website Audit

The existing website presents Cynbit's technology services through its navigation, service descriptions, visual elements, and contact options. The review identified opportunities to make navigation more intuitive, improve the visibility of important actions, and help prospective clients understand the available services more efficiently.

The proposed changes focus on functional clarity and usability while preserving the existing visual identity.

3. Key UI and UX Improvements

- **Improved Navigation and Accessibility**

Observation

Visitors benefit from having clear and predictable navigation options when exploring different sections of a website. A dedicated route to the homepage can make returning to the starting point more convenient.

Design Changes

A dedicated Home link was added to the navigation bar. The Cynbit logo was also made clickable, allowing visitors to return to the homepage from other sections of the website.

A separate Services navigation link was included in the homepage design to demonstrate a more direct route to the redesigned Services page.

Rationale

Providing familiar navigation options reduces the effort required to move between pages. Making the Services page easier to discover also helps prospective clients locate information about Cynbit's capabilities more directly.

Expected Impact

These changes aim to simplify navigation, improve access to important website sections, and create a more intuitive browsing experience.

- **Introduced Active Navigation States for Better Page Orientation**

Observation

When visitors move between different pages, they need a clear visual indication of their current location within the website. Without a distinct active state, navigation items may appear identical, making it less obvious which page is currently open.

Design Changes

The navigation uses a highlighted state for the active page. On the homepage, the Home item is displayed with a filled teal background and contrasting text to distinguish it from the other navigation links.

The same approach can be applied consistently across the website by highlighting the relevant item on each page. For example, Contact should be highlighted on the Contact page, while Services or its corresponding parent item, Expertise, should be highlighted on the Services page, depending on the final navigation structure.

Rationale

A consistent active navigation state provides immediate visual feedback and helps visitors understand where they are without having to interpret the page content or remember the route they followed.

Expected Impact

This approach aims to improve page orientation, make navigation more predictable, and provide a consistent experience across the website.

- **Optimized the Contact Page for Inquiries**

Observation

The original Contact page includes an animated visual alongside the contact information and inquiry form. Although the animation contributes to the website's visual appeal, the primary purpose of the page is to help prospective clients initiate communication with Cynbit.

Design Changes

The inquiry form was repositioned to the right side of the page, using the space previously occupied by the animated visual. This makes the form a prominent part of the initial layout while preserving the visual elements around the page.

A Project Type dropdown was introduced alongside fields for the visitor's name, email address, company name, and project details.

Rationale

Giving the inquiry form greater prominence prioritizes the page's primary task. It reduces competition between the decorative visual and the form, allowing visitors to identify the main action more easily.

The Project Type dropdown also gives visitors a structured way to communicate their requirements.

Expected Impact

The revised layout aims to make the inquiry process clearer, reduce unnecessary effort, and help visitors submit more relevant project information.

- **Improved Service Discoverability and Scannability Observation**

The existing service offerings cover several areas, including AI automation, LLMs and agents, software development, web and mobile applications, cloud infrastructure, and digital growth services.

Presenting numerous offerings within a dense block of information can make it harder for visitors to identify the services relevant to their needs.

Design Changes

The services were reorganized into four visually distinct cards.

AI Automation and Agents

Focuses on AI workflows, intelligent agents, chatbots, and process automation.

Custom Software and SaaS

Focuses on scalable software solutions, dashboards, platforms, and digital products.

Web and Mobile Applications

Focuses on websites, mobile applications, and digital experiences across devices.

Cloud and DevOps

Focuses on cloud infrastructure, deployment, reliability, and scalability.

Each card includes a clear title, a concise description, a relevant icon, and an Explore link to encourage visitors to learn more.

A dedicated Services navigation link was also included in the homepage design to demonstrate a clearer route to the redesigned service offerings.

Rationale

Grouping related offerings into separate cards creates a stronger information hierarchy and allows visitors to scan the content more easily. Concise descriptions communicate the purpose of each service without requiring visitors to process lengthy paragraphs.

Separating the offerings into clear categories also makes it easier to distinguish core engineering services from digital growth services.

Expected Impact

The redesigned layout aims to reduce the effort required to understand Cynbit's capabilities and help visitors identify relevant services more quickly.

4. Visual Design and Interaction

The redesigned screens retain a clean, professional visual direction suited to a technology company. The mint and teal colour palette, typography, spacing, card layouts, and iconography work together to create visual consistency.

The service cards are designed to support subtle hover interactions. These can include a more prominent border, a slight background colour change, a soft shadow, and a small arrow movement to indicate interactivity.

The visual direction prioritizes clarity and usability while adding enough visual feedback to make the interface feel responsive.

5. Design Principles

The redesign follows three main principles.

Clarity

Navigation labels, active states, service categories, and form fields should communicate their purpose clearly.

Efficiency

Visitors should be able to find relevant information and initiate an inquiry without unnecessary effort.

Consistency

Navigation behaviour, visual styling, and interactive feedback should remain consistent across the redesigned pages.

These principles guided the placement of the inquiry form, the organization of service cards, and the use of active navigation states.

6. Expected User Experience Outcomes

The proposed improvements are intended to support the following outcomes.

1. Easier movement between the homepage and other sections.
2. Clearer identification of the currently open page.
3. Improved visibility and discoverability of the Services page.
4. Faster scanning and understanding of service offerings.
5. A clearer path from exploring services to submitting an inquiry.
6. More structured project information through the Project Type dropdown.
7. A consistent visual experience across the redesigned screens.

These outcomes are expected benefits based on the design rationale. They have not been confirmed through formal usability testing or conversion data.

7. Scope and Limitations

The project focuses on selected interface improvements rather than a complete redesign of every section of the Cynbit website.

The work addresses navigation, page orientation, contact form layout, and service presentation. Further opportunities include reviewing accessibility, responsive behaviour across screen sizes, the clarity of business performance metrics, and the performance of the inquiry journey.

Additional evaluation would require usability testing with representative users to determine whether the redesigned pages make navigation and inquiry completion easier in practice.

8. Conclusion

The Cynbit redesign aims to make essential information and actions easier to discover. By improving navigation, introducing active navigation states, prioritizing the inquiry form, and presenting services through structured cards, the proposed interface creates a clearer path for prospective clients.

The design decisions focus on practical usability improvements while retaining the professional character of the original website.

The next step would be to evaluate the prototype through usability testing, gather feedback, and refine the interface based on observed user behaviour.
